Comprehensive National Nursing Home Training

1:00 – 2:00 PM ET
Introduction and Welcome

Sophia Autrey, MPH
Deputy Division Director
Division of Community and Population Health
Centers for Medicare & Medicaid Services (CMS)
Meet Your Speakers

Eli K. DeLille, MSN, RN, CIC, FAPIC
Infection Preventionist
Health Services Advisory Group (HSAG)

Deb Smith, MLT (ASCP), BSN, CIC, CPHQ
Infection Preventionist
Health Quality Innovators (HQI)

Kimberly Rask, MD PhD
Chief Data Officer
Alliant Quality

Susan Purcell, RN, BS, CPHQ
Project Director
TMF Quality Innovation Network
Establishing an Infection Prevention Program and Conducting Ongoing Infection Surveillance in the Nursing Home

Eli K. DeLille, MSN, RN, CIC, FAPIC
Infection Preventionist
Health Services Advisory Group (HSAG)
Key Elements of IP

- Develop a system for preventing, identifying, reporting, investigating, and controlling infection and communicable diseases for all residents, staff members, and visitors.
- Establish goals and priorities for the program.
- Plan and implement strategies to achieve goals, monitor compliance, and respond to identified issues.
Step 1—CDC* IP Training

- Designated IP lead should complete the CDC IP Training
- Self-paced training designed for working staff
- Continuing education credit is earned upon completion of training

https://www.cdc.gov/longtermcare/training.html

*CDC=Centers for Disease Control and Prevention
Step 2—QIO*-Developed Nursing Home Checklist

- Standardizes essential components of an IP Program
- Ensures consistency of training across staff members
- Defined criteria
- Simple format

*QIO=Quality Improvement Organization
https://www.hsag.com/globalassets/qii/ipsorientationchecklistfinal.docx
Step 3—ICAR* COVID-19 Self Assessment

Infection Prevention and Control Assessment Tool for Nursing Homes Preparing for COVID-19

This is an infection control assessment and response tool (ICAR) that can be used to help nursing homes prepare for coronavirus disease 2019 (COVID-19). This tool may also contain content relevant for assisted living facilities.

The items assessed support the key strategies of:

- Keeping COVID-19 out of the facility
- Identifying infections as early as possible
- Preventing spread of COVID-19 in the facility
- Assessing and optimizing personal protective equipment (PPE) supplies
- Identifying and managing severe illness in residents with COVID-19

*ICAR=Infection Prevention and Control Assessment Tool for Nursing Homes Preparing for COVID-19
Step 4—Develop a Customized Action Plan

Infection Prevention and Control Post-Acute Plan Prioritized Risks, Goals, Strategies, and Implementation

Pandemic Event (COVID-19 Preparation)

<table>
<thead>
<tr>
<th>Area of Concern</th>
<th>Root Cause</th>
<th>Strategies</th>
<th>Best Practices by Area of Concern</th>
<th>Implementation</th>
<th>Action</th>
<th>Evaluation of Effectiveness via Surveillance</th>
</tr>
</thead>
</table>

Nursing Home Name: ____________________________  CCN*: __________  Date: __________

Strategies, best practices, and metrics selected to address the infection prevention concern identified below are intended to be an initial guide only. A nursing home should perform an infection prevention analysis and risk assessment to customize a plan that will best meet the needs of their residents, staff members, and providers.

For each prioritized area of concern, identify goals, strategies, responsible person(s), timeframe, and evaluation of effectiveness.
Step 5/6—Solicit Feedback/Keys to Implementation

- Educate staff regarding expectations of care.
- Empower staff to speak up if they identify a concern.
- Engage staff, providers, and residents in IP practices.
- Modify the plan as necessary.

Can you name others?

Physicians, incl. Medical Director

Implementation Strategies for COVID-19 Surveillance and Early Detection
Three Key Steps:

1. Keep COVID-19 out!
2. Detect cases quickly
3. Stop transmission
Tips from Providers:

Manage Staff at the Door

- Wellness checks for all upon entering (checklists are available and spreadsheets for tracking)
  - Document the absence of symptoms (Respiratory symptoms, sense of smell)
  - Checking staff mid-shift* (every 4 hours)
  - Self-assess at end of shift
  - Well trained, non-direct care staff can provide this service
  - Use the opportunity to offer reminders at the door about areas that are in need of greater vigilance
  - Stagger shift start so as not to create traffic jams
Tips from Providers:

On an Operational Level:

- Invest in an organizational culture that prioritizes safety and wellness of staff (paid sick leave)
- Consider 12-hour shifts to limit numbers of staff and pad with extra staff from the eliminated third shift
- Know where agency staff have recently worked
- Encourage staff who work in more than one setting to work at only one single building and pick up extra shifts (if not, shower and new clothes)
- Prepare for staffing shortages-universal workers, waiver jobs, non-direct, DLT, volunteers
Tips from Providers:

Keep visitors away while increasing your communication resources

- Echo Show-Drop-in feature / Portal
- Communication chains
- Caring Bridge
- Lots of helping hands

- Limit vendor access
  - Special protocols for deliveries

- Have a clear return to work policy
Tips from Providers

- Daily rounds
  - Checked every day for signs and symptoms
  - AM meeting with Interdisciplinary Team-sharing information about every person
    - Appetite, cough, fall risk, other issues

- Mid-Shift Huddles

- Back to Basics and Good Assessment Skills
  - Watch for subtle signs
  - You are the eyes and ears
Tips from Providers:

- Wash resident hands
- Chess board pieces can be deadly if they go from room to room—thoroughly clean anything that will be used by others
- Provide alert residents with wipes and sanitizer (document in Care Plan)
- Hallway Activities
  - Remote control cars
  - Hallway activities viewable by many

Senior Quality Improvement Specialist
IPRO
Cohorting: Effective Management of Residents and Staff
Deb Smith, MLT (ASCP), BSN, CIC, CPHQ
Infection Preventionist
Health Quality Innovators (HQI)
Objectives

1. Understand cohorting as a core intervention of effective infection prevention programs
2. Become familiar with COVID-19 cohorting recommendations
Cohorting

**Goal:** Minimize the risk of non-infected residents interacting with infected or colonized residents and limit exposure to staff

**Residents:** Confine to one area those infected or colonized with the same infectious agent

**Staff:** Assign to a specific cohort of residents

Creating a COVID-19 Care Unit

- Standard precautions plus respirator, gown, gloves, eye protection
- Physically separate location if possible
- Dedicated nursing assistants and nurses
- Restrict ancillary staff whenever possible if unable to dedicate them to the COVID unit

Creating a COVID-19 Care Unit, continued

- Post signage at the entrance, including PPE instructions
- Keep the door closed or create a barrier at the entrance
- Train unit personnel in infection prevention, including PPE use
- Monitor PPE and implement optimization strategies if needed
- Dedicate resident care equipment that does not leave the unit
Staffing the COVID-19 Care Unit

• Assess adequate availability of all personnel
• Assign dedicated staff
  • Should not work in other areas of the nursing home or other facilities
  • Consider assigning dietary and housekeeping duties to nursing
• Enhance staff education
  • PPE use, COVID-19 signs and symptoms
• Limit access to other areas of the facility
  • Provide dedicated break rooms, supplies, separate entrance

Managing Residents with COVID Symptoms

• Residents with symptoms of COVID-19
  • Place in single room pending test results
  • Symptomatic cohorting only if single room not available
  • Intensified interventions for infection prevention and control
  • If COVID-19 confirmed, transfer to COVID unit or cohort with resident who has confirmed COVID-19

• Roommates of residents with COVID-19
  • Consider exposed and potentially infected
  • Single room preferred
  • Cohort with other exposed residents if single room not available

Cohorting Admissions and Readmissions

- All residents with confirmed COVID-19 not meeting transmission precaution discontinuation criteria should be cohorted or admitted to the COVID-19 unit
- Residents who meet transmission precaution discontinuation criteria can be admitted to regular units
- Residents with status unknown – Place in single room or observation area and monitor for evidence of COVID-19 for 14 days
  - All COVID-19 recommended PPE should be worn during resident care
  - Consider admission testing* to identify asymptomatic carriers

*Influenced by capacity for testing (access to swabs and PPE)

Discontinuing COVID-19 Cohorting

Continue transmission precautions and cohorting until criteria for discontinuation are met

- **Symptomatic resident**
  - Symptom-based: 10 days* since onset of symptoms, afebrile 72 hours, respiratory symptom improvement
  - Test-based: Afebrile, respiratory improvement, two negative COVID-19 results collected ≥ 24 hours apart

- **Asymptomatic resident**
  - Time-based: 10 days* post COVID-19 testing is still asymptomatic
  - Test-based: Two negative COVID-19 results collected ≥ 24 hours apart, is still asymptomatic

*Refer to your state or local regulations if longer

Cleaning to Prevent Infection Transmission

The nursing home environment is a reservoir for infectious agents, including COVID-19

• Enhance environmental cleaning during pandemics and outbreaks
• Clean rooms daily and after residents move or are discharged ("terminal" cleaning)
• Clean high-touch areas more frequently
• Use approved disinfectant [https://www.epa.gov/pesticide-registration/list-n-disinfectants-use-against-sars-cov-2-covid-19](https://www.epa.gov/pesticide-registration/list-n-disinfectants-use-against-sars-cov-2-covid-19)
Thank you!

Health Quality Innovation Network
Clinical Care
Managing COVID-19-Positive Residents
Meet your Speaker

Kimberly Rask, MD PhD
Chief Data Officer
Alliant Quality
Initial Symptoms *May Be Mild*

- No symptoms
- Minor symptoms with recovery (fever, respiratory, GI)
- Minor symptoms followed by rapid decline and respiratory/organ failure
  - Increase monitoring of ill residents, including assessment of symptoms, vital signs, oxygen saturation via pulse oximetry, and respiratory exam, to at least 3 times daily to identify and quickly manage serious infection.
  - Consider increasing monitoring of asymptomatic residents from daily to every shift to more rapidly detect any new symptoms.
Clinical Presentation in Older Residents is Often Not Typical

• “Dwindling” with no typical fever or respiratory symptoms
  – Fatigue, change in alertness, stop eating over several weeks
  – Importance of staff familiarity with residents and good communication

• COVID-19 associated with stroke and blood clots
Advance Care Planning

• Difficult but meaningful conversation
• With COVID it is crucial to have conversation and document in advance given lack of “typical” symptoms in many residents and potentially rapid clinical decline
• Does the resident want to be transferred to hospital if symptoms worsen?
  – Ventilator support available but high mortality rate
  – Ability to stay in familiar environment with comfort measures
Managing Symptoms

- Ensure availability of comfort medications for care in place
- Standing orders
  - Acetaminophen
  - Supplemental O2 and proning positions
  - Discontinue non-essential medications,
  - Change nebulizers to metered dose inhalers
- Quick access to concentrated opioids for shortness of breath
- CDC resources: Evaluate and Manage Residents with Symptoms of COVID-19:
Using Personal Protective Equipment

Susan Purcell, RN, BS, CPHQ
Project Director
TMF Quality Innovation Network
Objectives

• Understand why using personal protective equipment (PPE) is necessary for infection prevention
• Describe how to properly use PPE
• Understand where additional resources can be identified
PPE Defined

“Specialized clothing or equipment worn by an employee for protection against infectious materials.”

- Occupational Safety and Health Administration
Why use PPE?

• Used by health care professionals to protect themselves, patients, residents and others when providing care

• Protects from infectious patients, residents, lab samples, toxic medications, potentially dangerous substances used in health care
Types of PPE

• Gloves – protect hands
• Gowns – protect skin and/or clothing
• Face masks – protect mouth and nose
• Respirators – protect respiratory tract from airborne infectious agents
• Eye protection – protects the eyes
• Face shields – protect face, mouth, nose and eyes
Who needs PPE?

• Residents with confirmed or possible COVID-19 should wear a face mask
• Health care personnel should adhere to standard- and transmission-based precautions
• Recommended PPE is described in the Infection Control Guidance
Proper Use of PPE

• PPE must be donned correctly
• PPE must remain in place for the duration of work in potentially contaminated areas
• PPE should not be adjusted during resident care
• PPE must be removed slowly and deliberately in a sequence that prevents self-contamination
• A step-by-step process should be developed and used during training and resident care
How to properly use PPE

• Refer to guidance from the Centers for Disease Control and Prevention:
Identifying Correct PPE

- Standard Precautions for All Patient Care
- Transmission-Based Precautions

https://www.cdc.gov/infectioncontrol/basics/index.html
Donning

1. Identify and gather the proper PPE to don
2. Perform hand hygiene using hand sanitizer
3. Put on isolation gown
4. Put on an N95 filtering face piece respirator or higher that is approved by the National Institute for Occupational Safety and Health. Use a face mask if a respirator is not available
5. Put on face shield or goggles
6. Put on gloves. Gloves should cover the cuff (wrist) of gown

Preferred PPE – Use N95 or Higher Respirator

- Face shield or goggles
- N95 or higher respirator when respirators are not available, use the best available alternative, like a facemask.
- One pair of clean, non-sterile gloves
- Isolation gown

CDC logo
Doffing

1. Remove gloves
2. Remove gown
3. Health care professional may now exit patient room
4. Perform hand hygiene
5. Remove face shield or goggles
6. Remove and discard respirator (or face mask if used instead of respirator)
7. Perform hand hygiene after removing the respirator/face mask and before putting it on again if your workplace is practicing reuse

HOW TO SAFELY REMOVE PERSONAL PROTECTIVE EQUIPMENT (PPE)

EXAMPLE 2

Here is another way to safely remove PPE without contaminating your clothing, skin, or mucous membranes with potentially infectious materials. Remove all PPE before exiting the patient room except a respirator, if worn. Remove the respirator after leaving the patient room and closing the door. Remove PPE in the following sequence:

1. GOWN AND GLOVES
   - Gown front and sleeves and the outside of gloves are contaminated!
   - If your hands get contaminated during gown or glove removal, immediately wash your hands or use an alcohol-based hand sanitizer
   - Grasp the gown in the front and pull away from your body so that the ties break, touching outside of gown only with gloved hands
   - While removing the gown, fold or roll the gown inside-out into a bundle
   - As you are removing the gown, peel off your gloves at the same time, only touching the inside of the gloves and gown with your bare hands. Place the gown and gloves into a waste container

2. GOGGLES OR FACE SHIELD
   - Outside of goggles or face shield are contaminated!
   - If your hands get contaminated during goggle or face shield removal, immediately wash your hands or use an alcohol-based hand sanitizer
   - Remove goggles or face shield from the back by lifting head band and without touching the front of the goggles or face shield
   - If the item is reusable, place in designated receptacle for reprocessing. Otherwise, discard in a waste container

3. MASK OR RESPIRATOR
   - Front of mask/respirator is contaminated — DO NOT TOUCH!
   - If your hands get contaminated during mask/respirator removal, immediately wash your hands or use an alcohol-based hand sanitizer
   - Grasp bottom ties or elastics of the mask/respirator, then the ones at the top, and remove without touching the front
   - Discard in a waste container

4. WASH HANDS OR USE AN ALCOHOL-BASED HAND SANITIZER IMMEDIATELY AFTER REMOVING ALL PPE

PERFORM HAND HYGIENE BETWEEN STEPS IF HANDS BECOME CONTAMINATED AND IMMEDIATELY AFTER REMOVING ALL PPE
Face mask Do’s and Don’ts

• When putting on a face mask:
  › Clean your hands and put on your face mask so it fully covers your mouth and nose

• When wearing a face mask, don’t do the following:
  › Don’t wear your face mask under your nose or mouth
  › Don’t allow a strap to hang down. Don’t cross the straps
  › Don’t touch or adjust your face mask without cleaning your hands before and after
  › Don’t wear your face mask on your head
  › Don’t wear your face mask around your neck
  › Don’t wear your face mask around your arm

Facemask Do’s and Don’ts
For Healthcare Personnel

When putting on a facemask
Clean your hands and put on your facemask so it fully covers your mouth and nose.

When wearing a facemask, don’t do the following:

- DON’T touch or adjust your facemask without cleaning your hands first and often.
- DON’T wear your facemask under your nose or mouth.
- DON’T allow a strap to hang down, DON’T cross the straps.

When removing a facemask
Clean your hands and remove your facemask touching only the straps or ties.

CDC.gov/coronavirus

Additional information is available about how to safely put on and remove personal protective equipment, including facemasks:
